Part one specifics:

While classification is a major technical challenge in any export compliance program, the good news is regulators have provided a clear guide to the process that should be followed called the "Order of Review". It seems simple enough in theory: Start with ITAR, look for specific listings, then look for "catch all" controls, then go to the EAR and do the same thing looking at 600 series and 500 series first. But hidden in this simple process are the intricacies of product types, technical requirements for releasing from catch all controls, intentionally specific definitions, and some intentionally vague definitions. This webinar will help clear up the process and answer your questions about the order of review by covering the following topics:

•   Basic questions such as:
        - What needs to be classified?
        - Who should be classifying it?
        - When should classification happen?
•   The critical step of identifying your product and gathering information before starting the Order of Review:
        - Product types (System, Equipment, Software, Technology/Technical Data etc.)
        - EAR Group type
        - Design intent and uses
        - Related products and known classifications
•   A step-by-step walkthrough of the Order of Review for ITAR and EAR, including topics such as:
        - Overview of the United States Munitions List (USML) and the Commerce Control List (CCL)
        - Identifying enumerated items
        - Specially Designed: the catch and release process
        - Comparing and contrasting Technical Data (ITAR) vs Technology (EAR)
